

Export Aging Information from Oracle AR to D&B's DNBI Platform

Real-time information, from your internal Oracle Receivables system and from external sources like D&B, is crucial to making good credit decisions in today's fast-changing business environment.

Hub Solution Designs offers the *Oracle-DNBI Connector*, allowing you to export customer aging information to D&B's DNBI risk management application.

Challenges

Oracle E-Business Suite (Release 11i) is a popular Enterprise Resource Planning (ERP) application for corporate finance departments.

Most IT groups don't have the time or resources to create a custom interface between the customer aging information in Oracle Receivables and D&B's DNBI risk management application.

But without that, you aren't getting the full value of your investment in DNBI.

Solution

Hub Solution Designs' *Oracle-DNBI Connector* is a low-cost, pre-built solution.

It consists of four parts:

- A SQL statement to create a CSV file from Oracle AR aging data
- A new Concurrent Request so Oracle can run this (typically on a daily basis)
- PGP encryption to ensure your data remains completely secure at all times
- Files are transmitted to D&B via secure FTP

Deliverables

The deliverables consist of a design document containing the required SQL statement and the steps to build the remaining components.

Two days of consulting services are included, to install the *Oracle-DNBI Connector* in your environment, as well as end-to-end testing with you and your D&B account team.

Hub Solution Designs is very familiar with Oracle and D&B, and can help with related areas as well.

Benefits

The cost of the solution is much less expensive than creating a custom interface from scratch.

And the Hub Solution Designs team stands behind every project.

The solution provides for sophisticated and secure transmission of sensitive data to D&B through PGP encryption and secure FTP.

This closes the loop so your DNBI application has the internal AR aging information it needs from Oracle.
