

Assembly instructions for the grip handle

Please read these instructions first before you start.

Contents:	Single item	Pair
Grip rails	1	2
Screws (M6 30 mm)	8	16
Fixing brackets	4	8

1. If you have put the rubber caps on the trampoline, remove these again from the legs. (The plastic plugs can remain on the end of the legs.)
2. Attach the fixing brackets with 2 screws each to the corresponding parts on the grip rails. Gently turn the screws just enough so that the brackets are still wide open.
3. With legs screwed on now turn the trampoline on its side and from underneath line up a grip rail with the fixing brackets on two of the legs.
4. Now carefully turn the trampoline back on its legs and fully tighten all screws on this grip rail.
5. Repeat steps 3 and 4 on the opposite side of the trampoline. Now you can put the rubber caps back on the legs.
6. Now carefully make sure that the handles are attached properly and do not wobble. If they do, the screws have to be tightened again.
7. Grip handles are only designed as a support to steady balance. Do not lean over the handle and do not jump up against it, as this could result in the entire equipment toppling over.
