

## A Single User Interface For Activation Pin-Pointed Multiple Alerting Devices

AlertNET Message Creation Tool is a highly efficient and easy to use software that provides scenario based pin-pointed alerts and messages. One interface is used to activate all warning devices, streamlining the warning process.

When an emergency is taking place, time and accuracy are of utmost importance. AlertNET Posting Tool was designed with that in mind.

Messages are highly customizable based on pre-defined scenario, the group or area to be notified, the expected action required in an emer-

gency situation, the expected duration of the event and more.

In addition, pre-defined messages include specific instructions and can be modified based on conditions present.

The alerts and notifications can be delivered via a wide variety of devices such as sirens, pop-up messages on computers, PA, pagers, telephone, cell phones, Blackberries, PDAs, emails, and more.

### How It Works

A browser based application allows authorized users to access the server. They can select the type of emergency, area alerted and record a message and select multimedia.

The AlertNET server authenticates the user, and posts the alert message in its database.

A controller or software associated with the alerting tool (such as the siren, pop-up software, PA, etc. ) continuously monitors the AlertNET server for alerts and messages.

### Step 1: Select the areas to be alerted. Optionally, select a scenario
